**Subject:** NYISO: Winter Weather Underscores Importance of Propel NY Energy

This winter, our electric grid was again pushed to its limits, underscoring why the Propel NY Energy transmission project is a regional priority. According to a recent analysis from the state power grid manager, the New York Independent System Operator (NYISO), Winter Storm Fern's freezing temperatures put significant strain on the electric grid, finding that transmission capacity on Long Island was "bottled." As a result, costly resources had to be deployed to satisfy power demands. "Constraints on the transmission system meant available generating capacity on Long Island could not be delivered to where it was needed," the NYISO states.

**The NYISO identifies Propel NY Energy as "one of the most significant transmission investments underway"** to unbundle energy constraints and allow customers to receive the power needed during extreme weather.

## Long Island Transmission Security Margin F

With shrinking security margins, the NYISO warns of the consequences of not moving forward with investments in transmission. **“Without investment in the Propel NY project, Long Island transmission security margins (a measure of how much stress the system can absorb before it can no longer reliably serve load) are expected to erode completely by 2031.”**

The NYISO further stated, **“As extreme weather becomes more frequent and complex, transmission investments like Propel NY will play an essential role in strengthening New York’s ability to maintain reliability in all seasons.”**
